PLATFORM STORY

SEEINGFLOW digitizes access control

SEEINGFLOW packages identity, credential policy, visitor flow, intercom, device health, and security data into one operating layer for parks, campuses, commercial buildings, and mixed-use estates.

Identity First

Unify employees, contractors, merchants, property teams, residents, visitors, and service partners under managed lifecycle rules.

Policy Driven

Control access by point, floor, time slot, department, blacklist, whitelist, and temporary authorization.

Evidence Led

Every opening event becomes searchable operational evidence with time, identity, device, method, and photo context.

Ecosystem Ready

Connect access with elevator, parking, CCTV, property management, attendance, robotics, and enterprise workflow platforms.

MULTI-MODAL ACCESS

Six ways to enter, one policy engine behind them

Staff, residents, visitors, maintenance teams, and executives each get the access method that fits the moment, while administrators retain centralized control.

Facial Recognition

Hands-free entry with live-detection protection and local cache support.

NFC and IC Card

Employee badges, owner cards, visitor cards, and cloud revocation.

Dynamic QR Code

Encrypted, time-refreshing codes for employees and temporary visitors.

Bluetooth Proximity

Nearby mobile detection and shake-to-open for frequent commuters.

Password Entry

Local numeric access and one-time temporary codes with expiration.

Remote Command

Web and app operators grant remote opening or temporary access.

Continuity Built In

Authorized users continue to enter during network interruptions. Devices cache face data, card credentials, and permission settings locally, then synchronize logs and photos after reconnection.

PRECISION CONTROL

The right person, the right door, the right time

The policy model moves beyond allow-or-deny access into contextual control across locations, floors, people groups, and operating windows.

●

Point Permissions

Authorize specific gates, unit doors, offices, passages, rooms, and elevator controls.

●

Time-Slot Rules

Set windows such as weekdays 8:00-18:00 or daytime-only contractor access.

●

Floor-Linked Access

Facial scan at the lobby unlocks only authorized floors for that identity.

●

Batch Group Rules

Apply permissions by company, department, building, project, or role.

●

Blacklist Control

Block restricted individuals and trigger instant alerts with captured photos.

●

Whitelist Privilege

Enable critical 24-hour access for executives and emergency personnel.

Permission Matrix

	Door	Time	Floor
Staff	●	●	●
Visitor	●	●	●
Contractor	●	●	●
Emergency	●	●	●

Rules sync to devices in real time

Operational result

Access policy becomes auditable, repeatable, and simple to update across high-volume property operations.

VISITOR AND INTERCOM

Visitors move through a traceable digital lifecycle

Reservation, verification, temporary access, on-site fallback, and departure records are treated as one service flow rather than separate front-desk tasks.

**Video Intercom**

Apps, monitors, or command desk verify video and release doors remotely.

Emergency Alarm

Alarms notify backend operators and security phones with scene capture.

Active Monitoring

Operators open live feeds for door stations and cameras at critical access points.

No Front Desk

Digital visitor entry with a complete property-team audit trail.

DATA AND SECURITY

Every access event becomes actionable evidence

The cloud archive supports security review, operational planning, device maintenance, and service improvement from the same event record.

Report Type	Example Metrics	Primary Use
Traffic Flow	Hourly and daily counts	Capacity planning and staffing
Building Analysis	Entries by building and floor	Occupancy trends and resource allocation
Visitor Stats	Reservation source and duration	Service improvement and SLA review
Alert Summary	Blacklist and anomaly triggers	Risk assessment and security review

Door Status

Left open, forced open, or device-sensor fault.

Unauthorized Attempt

Blacklist or invalid credential interception.

Overtime Visitor

Visitor credential exceeds authorized time.

Device Fault

Network, power, reader, or terminal malfunction.

From reactive response to proactive physical security operations.

INTEGRATION VALUE

A central access layer for smart-park operations

The access module is designed to work as a node in the wider SEEINGFLOW estate platform, connecting people movement with elevators, vehicles, video, work orders, robotics, and enterprise workflows.

Core value proposition

Reduce manual work, strengthen identity control, improve visitor flow, retain audit evidence, and connect access with property operations.

CATALOGUE SUMMARY

What the SEEINGFLOW catalogue includes

A practical SaaS-oriented product package for teams that need secure access, fast visitor throughput, and evidence-based property operations.

Identity and Personnel

Batch import, app self-submission, category management, lifecycle activation, and deactivation.

Credential Services

Face, card, QR, Bluetooth, password, remote command, and visual intercom release.

Policy Control

Permission rules by point, floor, time slot, organization, role, blacklist, and whitelist.

Visitor Operations

Reservation, temporary credential, on-site fallback, host confirmation, and trajectory export.

Security Operations

Alerts for door anomalies, unauthorized attempts, overtime visitors, and device faults.

Integration Layer

Elevator, parking, CCTV, property management, robotics, attendance, OA, and open API.

Recommended story flow

Position the solution as a cloud service for trusted movement: first explain why access should be centralized, then show multi-modal entry, precision policy, visitor workflows, security analytics, and integration value.

SEEINGFLOW | Smart property operations, connected physical access.
